

How to Develop 10-Year Harvest Maps

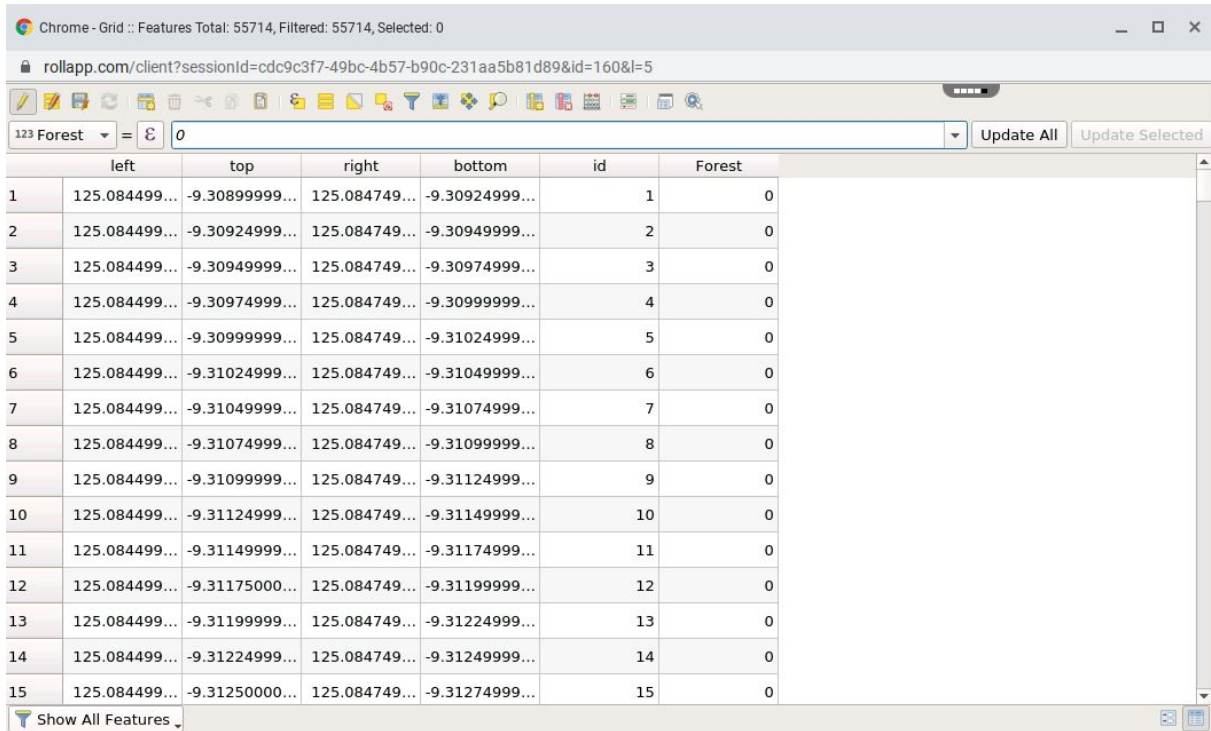

1. Plan the harvest over a number of years. This example will use 10 years. It will also harvest the landscape in equal sized land strips (so not timber volume).
 - a. Strips serve our purpose for now: As explained for [reforestation](#) before, areas that have the same conditions (soil, climate zone, species, etc.), the emissions outcomes for the harvest are only dependent on the size of the reforested area not on the shape of the area.
 - b. The approach below can also be used if the shape of the area does matter. The selection of such a shape is described in the [reforestation](#) explanation.
2. If you have not created a vector-grid of the project area yet, follow the steps below. Otherwise, use the existing vector grid and go to step 6 below.
3. Load the latest historical observation called year_clip.TIF
4. Click Processing > Toolbox > Vector Creation > Create Grid

- a. Create a vector grid
- b. Ensure at least one map of the area is uploaded onto the workspace (like 2018 East Timor forest cover)
- c. Search and select "Create Grid" under "vector creation" toolbox
- d. Grid type = Polygon
- e. Grid extent = "use layer extent" and select the forest cover 2018 map
- f. Horizontal spacing and vertical spacing are pixel size: i.e. 0.00025
- g. Horizontal and Vertical Overlay = 0.000000
- h. Grid CRS = Should automatically select same projection as the layer you chose for extent (should be EPSG:4326 – WGS 84)

i. Grid = >save as a file

5. Create a Forest feature in the grid

Chrome - Grid :: Features Total: 55714, Filtered: 55714, Selected: 0

rollapp.com/client?sessionId=c9c3f7-49bc-4b57-b90c-231aa5b81d89&id=160&l=5

Show All Features

- Right click the new grid in navigation bar on left > open attribute table
- Toggle editing (click on pencil in corner)
- Select "create field"
- Name = Forest
- Type = Whole number (integer) (and wait for it to load)
- Type 0 into the expression area and "Update All" > This will make the whole grid = 0
- Click edit button (little pencil) and save changes
- Exit attribute table

6. Below harvest is based on strips of 10 % of total area:

Show All Features

- For a total harvest over 10 years, 10 strips of 10% of the area need to be harvested. There are 55'714 pixels. So each year 5'571 pixels need to be harvested.
- For the first 10% use the following expression in the calculation bar: $(id > 5571)$ and click Update All

7. Transfer Vector Grid to TIFF Raster Toolbar>Raster>Conversion>Rasterize

Chrome - Rasterize (Vector to Raster)

rollapp.com/client?sessionId=cdc9c3f7-49bc-4b57-b90c-231aa5b81d89&id=247&d=1&l=4
